Beamal Art Studio Website and Management System Proposal

Prepared for discussion | 30 September 2026

1 Purpose and proposed outcome

This proposal sets out how a public website and a connected class management system could support Beamal Art Studio. The immediate aim is to review the interactive sample with the studio, understand its real operating process, and agree what a production system should do before fixing scope, cost or technology.

The proposed outcome is a clearer path for families to discover classes and register, together with a simpler way for staff to manage schedules, confirm payments and review records. The website can also provide a home for Beamal's artwork, story and news, using content approved by the studio.

2 What can be reviewed now

Interactive sample: https://beamal-art-studio-sample.vercel.app/

Area	Available in the sample	Production status
Public website	Home, About Us, Portfolio, Classes, News, FAQ, Join Class, language switch and mobile layout.	About Us, course text, FAQ and policy include placeholders; news and fees are examples.
Class registration	Choose a course and time, enter student details, submit and see a payment step.	Submission and payment are simulated; no live payment or email.
Student view	Sample login, My Calendar, My Classes and Payments & Profile.	No real account verification or shared database; changes stay in this browser.
Manager view	Sample class settings, student and booking lists, payment records, income chart, Excel output and news editing.	Course fee and description editing are not present; teacher permissions are a preview.

To explore the sample, enter username 1 for Alex Chan's student view or 2 for Teacher 1 (Manager); leave the password blank. These shortcuts exist only for review. The sample stores demonstration changes in the current browser and can be reset. It does not process real payments, send messages, or securely store real student records.

3 Proposed registration and payment journey

The following is an operating model for discussion, not a claim about Beamal's present rules. A family should be able to understand availability and submit a request without having to repeat the same details across messages.

Step	Student or family	Studio and system
1 Discover	Browse classes, artwork, suitable ages, price, weekly time and available places.	Maintain approved course descriptions, images, prices and capacity.
2 Choose	Select a course and a recurring class time. A full class is clearly marked.	Keep each class time under its course, with a unique class code for internal use.

Step	Student or family	Studio and system
3 Submit	Enter student name and contact details, review the choice, then submit.	Record submission time and show the request as awaiting payment.
4 Pay or verify	Either complete an enabled online payment or use an agreed alternative method.	If payment is taken outside the site, an authorised staff member checks it and marks the record paid.
5 Join the class	See confirmation after payment is verified.	Change the enrolment to joined, update the class list and issue any agreed confirmation or account invitation.
6 Follow classes	Log in to see enrolled classes, lesson dates and payment history.	Review the student roster, capacity and income records from the manager view.

4 Practical example

A family selects Course 1 and its Monday 10:00 class, enters the student's contact details and submits. The request appears in the manager's new enrolment list with its submission date and an awaiting-payment status. It is not counted as a confirmed student yet.

If the family pays through a future online payment service, a successful payment would confirm the enrolment automatically. If the studio receives payment by another method, an authorised teacher or manager would verify the receipt and confirm it in the system. Only after that confirmation would the student appear in the paid class roster and see lessons in My Calendar.

The current sample uses four lessons per term. For a weekly Monday class, the calendar illustrates four eligible Mondays starting after payment confirmation. The actual lesson count, start rule, holidays, missed classes and renewal process must be confirmed with Beamal before implementation.

5 Day-to-day use for the studio

Task	Proposed staff action	Useful result
Manage courses	In the sample, edit the course name, photo, recurring times, capacity and lessons per term. Add description and fee editing in production.	Families see one course with suitable times; staff can distinguish classes by code.
Handle new requests	Open a dated list of unpaid or pending enrolments; verify payment or follow up.	Staff can see which requests still need action.
Manage students	Open a class roster or search a paid student; view and, where authorised, correct contact details.	One record supports class administration without asking families repeatedly.
Review collections	Check payment dates, monthly totals and individual records; export a spreadsheet when needed.	Easier reconciliation and management review.
Publish news	Prepare and edit approved studio news, events or awards before publication.	Families can follow Beamal's latest activity from the website.

Task	Proposed staff action	Useful result
Manage teachers	Assign access according to each staff member's work.	Sensitive student and financial information can be limited to appropriate roles.

The teacher-management screen in the current sample is a visual preview only. Creating teacher accounts and enforcing permissions would require a production system.

6 Proposed delivery phases

Phase	Work and practical outcome	Decision gate
A Confirm operations	Review the sample with Beamal; document actual courses, class rules, payment methods, staff roles, content, privacy needs and exceptions.	Approve a written scope and priorities.
B Launch essential system	Build secure accounts, a shared student and booking record, course and capacity management, manual payment confirmation, student calendar and manager lists.	Test real operating scenarios with staff before launch.
C Add integrations	Connect an agreed online payment provider and account or class notifications; add reporting refinements.	Confirm provider terms, fees, refunds and message content.
D Extend if valuable	Consider attendance, make-up classes, renewals, finer teacher permissions or separate apps.	Only proceed where the studio workflow justifies them.

The public sample is already hosted for review. A production release would need separate work on security, backups, data protection, payment handling and ongoing support. The technical tools should be selected after the business process is agreed; this proposal does not commit Beamal to a particular database, server or payment provider.

7 Questions to settle with Beamal

- Who normally enquires and pays: the student, a parent or another guardian? Who should own the login?
- What are the current course names, prices, ages, term lengths, weekly times, capacities and holiday rules?
- When is a place held or confirmed? What happens if payment is late, a class is full, or a family cancels?
- Which payment methods are used today, and who may confirm a non-online payment or issue a refund?
- Which staff need access to student details, class settings, news and financial reports?
- What information belongs in a receipt or report, and what does "accounting" mean for the studio?
- Which photographs, logo files, course descriptions and studio policies may be used on the public site?

8 Next discussion and scope agreement

We suggest a short walkthrough of the sample followed by a discussion of one recent real registration from first enquiry to payment confirmation. That example will reveal manual steps, exceptions and information the studio needs at each point. We can then revise the screen design and prepare a production scope, timeline and price based on confirmed requirements.

The sample is a discussion tool. Features described as proposed are not yet live services, and no real student data should be entered into the sample.
